Assignment-1

Unit-1: Intuoduction to Machine Learning

Machine Leauning: Machine Leauning is a subfield of autificial intelligence, which is broadly defined as the capability of a machine to imitate intelligent human behavior. It focuses on the use of data and algorithms to initate the way that humans brown, quadrally improving its accuracy.

Machine leaving is an important component of the guarding field of data science. Through the use of statistical methods, algorithms are trained to make classifications or predictions, and to uncourte key insights in data mining projects. These insights subsequently drive decision making within applications and businesses, ideally impacting key growth metrics machine leaving algorithms are typically avaited using frameworks that accelerate solution duelopment.

Machine Leauning is concerned with using the hight features to build the hight models that achieve the night models that achieve the night tasks.

Through machine harning, models can be produced quickly and automatically to analyze bigger, more complex data and deliver faster; more accurate results, even on a very large scale.

Following are the burefits of machine harning:

Faster decision making: It allows the were to process
and analyze data more quickly, enabling uppideven spirt-second-decision making.

	A contract to the second of th
#	Accurate forescapting: Incorporation of machine
-	leauning models into the data analytics can
	help individuals ou businesses to gain fau
	mone accurate and pouverful capabilitées to
5	forecast results, such as product dimands.
#	Boosting efficiency: The use of machine learning
٠.	accelerate sepetitive tasks and miduces
	human effort.
	at the time and analysis the time the time
	Applications of Machine Learning
	The applications and uses of machine leaving
	are vast and diverse Some of them are
	Comment with a first and a second to the
#	Recommendations: The sucommendations provided
	by populare streaming platforms like spotify
	and Netglise, ou by social media platforms such
	as facebook and instagram, are based on
	machine learning algorithms. They analyze the
	content your listers, watch ou follow, and suggest
	additional content you may enjoy
- ; + -	and the state of t
# /	Fraud detection: cloing machine learning models,
	banks and other financial institutions can
	identify transactions that fall outside typical
	parameters - such as purchase amount and user
	location - and alust you when unusual activity
1	occurs.
•	The state of the s
#	Stauch engine vesults: Furing time you type a
	0 0

	seauch teum into Google, machine learning algorithms
	analyze your behavior to refine the future delivery
	of acousts.
22	
#	chatbots: when you that with an Al-based assistant
	to resolve an issue online, a trained machine
	learning model is at nearly, providing automated
	appurpulate susponse based on your input.
#	spam filters: By analyzing characteristics in
	subject lines, body content and enturn addresses,
	machine leauning algorithms use neural networks
	to help protect your inbox from univarted enails.
#	aestomer retention: service provideres very on machine
	learning models to edentify customers were may
	be ready to take this businesses elsewhere. 2
	you've stopped using a cuedit caud and suddenly
	succined an email office for a loner APR, your
	audit coud puouider is likely attempting to boost
	customer retention with the neep of a machine
	eauning - based platform
#	Sentement analysis: Also called opinion mining or
	emotion AI, sentiment analysis uses notural
	language processing and machine learning to
	understand the underlying sentiment in social
	media posts. Businesses can use this analysis
	to discour how people feel about their brand
	on product

#	Real estate valuation: By analyzing available
	dota on a home's features and the sales of
	comparable nouses in its vicinity, machine
	leauning algorithms estimate the cussent value
1.7	of real cotate pou websites like zielour and Reafin.
#	hanning apps: Educational tools like the Dudlingo
	language platform vol machine learning models
	to analyze data gathered from nous and
	adjust the pacing of courses as heeded.
#	Medical image processing : For health care
	companies, machine leauning radiology platfours
	can be trained to identify potential issues in
f A	patient x-mays, fragging them as warranting
	further attention.
	The state of the s
1 1 1	Structure of drawing
	Following steps may be involved in the structure
1000	of machine leavening
, į	
1.	Data collection - The quantity and quality of data
	collected mil directly determine how accurate
5	the model is the outcome of this step is
	generally a superesentation of data which will
	be used fou tuaining.
	an amount stone of the word to myanate data
2.	Data purpuocessing - It is used to muangle data
,	and purpose ut for training. Charing of data such as himoval of duplicates, correction of essays,
	Such w
	Page No.

Date ___ / ___ / ____

	dealing with missing values, normalization, data type conversion, etc aux done at this stage. Data is
	visualized to help detect believant relationships between
	variables. Data is spirt training and evaluation sets.
	' 0
3.	Selection of model - Different algorithms are for sifferent
	tacks, the most apperopriate one is chosen on the
-	basis of puoblem domain.
4.	Training of model- The goal of training is to ansure
	a question ou make a pendiction correctly as often
	as possible. Each iteration of puocess is a training
	step.
5.	model teoling - This step uses some metric or combination
	of netries to measure objective purjournance of model.
	The model is tested against perwiously unsein data.
	The same of the sa
6.	model deployment/ waluation - model penjoumance in the
	wal world is walkated, and model parameters
	au tuned so imperoue performance.
	Machine Leauning Tacks
	A machine learning task is the type of pudiction
	ou inference being made, based on the problem
	ou question that is being asked, and the available
1	ou quistion the will on patterins in the data.
	data. These tasks mely on patterins in the data.
	annication, there are tollowing
: 1	on the basis of application, there are following
	four types of machine leauning tasks-

	Date//_
→	Recommendation systems
\rightarrow	Classification tasks
2	Ruidicture tasks
\rightarrow	Descriptive tasks:
#	Recommendation systems - It was big data to ucommend
	additional puoducts to consumers which are sullement
	on the basis of past purchases, helps websiles to
	impuoue vou engagement, sending peusonalized
	content, etc. i con in the said of the said of
	and the state of t
#	Classification tacks - teue, model is used to categorize
	the input data anto different labels by the help
	of training data for example: classifying emails into
	caligories (puimary, social, promotions and spam)
, h	
# .	Prudictive fasks - budictive analytics is used to obsume
	weent data tuends and predict the future event
	ou other data ou trends to is based on the
	proactive approach. For example ! meather forecast,
	trends in share market, etc.
#	Descripture tasks - Descripture fasks are generally about
4.11	publiding correlation, cross-fabulation, frequency, etc.
17	The techniques or models are used to determine the
	data regularities and to reveal pateurs. Description
	tacks focus on "what has happened in the past?"
	e and prouvide useful data. Fou example: helping
	companies in recruitment, maintaining inventories, etc.
5	

	Defference between pudictive	and descriptive tasks:
, .		
5 X	Predictive tasks	Descripture tasks
' →	These include pudiction of	- These involve providing
	future went or other	correlation, cross-tabulation,
	data ou tuends	fuquency, etc.
->	These are based on the	-> These are based on the
	puoactive approach	reactive approach.
\rightarrow		
	They require execution of	of characteristics of data
	and sont date in the	in a mayout data set.
	and past data so that	
	pudiction can happen.	
-	Outcomes puoduced do not	-> output data is percise.
	ensure accuracy.

	Machine Leaving models	
	models are the centual co	nicipt en machère leauning
	as they leaven from data	In ouder to some a gueen
	tasks. There is a large no	inge of machine learning
	models that are available	due to the omnipulsence
	of tooks that machine lea	uning alms to solle. in
	we have of structure of	acco, mainte ecaning
	models can be categorized	(D) -

#	Geometric models - Geometric models use the technique
	of combining machine leauning and computer vision
	to some visual tasks. These models define similarity
	by considering the geometry of the instant space.
• .	Geometric models are basically of two types:
->	Lineau models: These use geometric concepts such as
	lines ou planes to segment the instant space.
->	Non-lineau / Distance - based models: of the distance
	between two instances is small then instances are
	similar in turns of their feature values.
	The second of th
	There are different linear models sike the beast -
	squares method, support vector machine, etc.
	Various distance-based models include RNN (k- manest
	nighbours, K-means, hierarchial clustering, etc.
#	Puobabilistic models- A puobability model I method is
	cases on the theory of perobability, on the fact
¥.	renaemness plays à vole en peudictina
	fittell wents. Thise models take into account
	impact of random wents on actions in
	predicting the potential occurrence of futiere pertromes.
	puobabilistic models is
	gue an idea about the uncertainty
	the linked with pudictions. The best known
-	algorithm in this group is the Maire Bayes
	algorithm.

#	Logical models - Logical models use a logical
	expuession to divide the instance space into
	sigments and hence construct grouping models. A
	logical expussion is an expussion that littleins
	a boolean value, i.e., a luce out fatte ducome. once
	the data is grouped noing a logical expression,
	the data is divided into homogeneous quoupings
	for the peroblems we are truying to some there
	for the private of spaced models: True
	are mainly two kinds of logical models: True
	models and relie models.
	a martings and the state of the
	Leauning-based catigories en Machine Leauning
	In general, most machine leauning techniques can be
	classified into supremised dearning, unsuperiered
	beauning and winforcement bearing.
	A STATE OF THE STA
#	Supervised Machine Learning - An supervised machine
	having, the algorithm is provided an input
	detaset, and is seemanded on optimized to meet
	a set of specific outputs. There are tree types of
	supermised leauning-
	,
\rightarrow	classification: It is a process of finding a function
	which helps in dividing the data set
	which helps in dividing the dataset into
	peredetermined classes based on different parameters.
	eg-email catigories. Here, output variable is a discrete value.
	leguession: Reguession is a process of finding the
_	cossilations between dependent and independent variables.
	It nelps in predicting the continuous variables, such
- 1	V

	as pudiction of market trends, nouse prices, etc.
	une, output variable is of continuous noture of
	teal value
# .	Unsupervised machine learning - m unsupervised
	machine leauning, the algorithm is provided on
	input dataset, but not euwanded on optimised
	to specific outputs, and instead trained to group
	objects by common characteristics. For example,
	recommendation engines on online stories sely on
	unsupervised machine learning, specifically a
	technique called clustering
8	
# /	Reinforcement learning - In everyorcement learning,
	the algorithm is nade to train itself using
	many trial and every experiments. Reinforcement
^	leaving happens when the algorithm interacts
	continually with the environment, wather than
	relying on training data. One of the most popular
-	examples of reinforcement learning is autonomous
	driving.
